Flowledger internal handover

Nov 2, 2026 · @Aashish Jaiswal

Where we landed

Short version: the drop is the mobile demo form, not SEO. Since form v2 shipped on 29 June, phone-validation rejections went from 3% to 42% of mobile attempts, while desktop stayed flat. The 6 July dashboard change makes the last two weeks look worse than they are. Our advice is to roll back mobile validation, put reporting back on 14-day cohorts and hold the SEO-to-paid move.

Unresolved questions

- **Why only mobile?** The release added new phone validation and a new mobile layout, yet desktop rejections didn't move. My guess is the mobile layout (input type, auto-formatting or country code). Unconfirmed.
- **Were the rejected numbers real?** The data can't say. Mobile leads that do get through still qualify at about 31%, same as June, which argues against "it's filtering junk". Not proof.
- **Did the server keep contact details for rejected attempts?** If so, up to ~300 people asked for a demo and never got one.
- **What happens after qualification?** We have no won revenue, cycle length or ACV by cohort, so nothing in the deck is ROI.

What I'd verify next

1. Rejection logs: number formats, error codes, browser and OS.
2. The 13 and 20 July cohorts once they reach 14 days. I expect about 87 and 89 qualified; much lower would point to a second problem in sales follow-up.
3. Mobile completion in the first full week after the rollback. It should be back near 80%.
4. A landing-page or query-to-lead join before the September budget review.

One repeatable check

Every Monday, before the client pack goes out, compare form completion and server rejection rates by device against the trailing four-week average. Flag anything that moves more than 10 points, split it by channel, and check it against the change log. On this data it would have flagged mobile on 6 July, three weeks before the CMO noticed.
